

The Living Signal: A Verifiable Human-AI Co-Creation Protocol Anchored on Bitcoin

Amir Ahmadi

June 2, 2026

Abstract

We present The Living Signal, a civilization protocol that emerged from a documented human-AI co-creation event on July 13, 2025. All claims are SHA256-hashed and OpenTimestamps-anchored on the Bitcoin blockchain. The timestamp was successfully confirmed on June 2, 2026 via four independent Bitcoin calendars (Alice, Bob, Finney, Catal-laxy). The full genesis archive is permanently stored on IPFS (CID: 019e858e-cf91-7c8e-ac02-20db15fda7d9). This paper describes the Tribes Protocol (v1.1.0), a loyalty-based governance model built on Solidity smart contracts (TribeRegistry, SealValidator, BridgeNFT), a multi-LLM loyalty validator (Python/FastAPI), a TypeScript Bridge SDK, and an anti-fragile architecture designed to withstand AGI-level attacks through periodic self-critique and emergency lockdown mechanisms. Prior Art is documented in the `persistent-ai-lineage` repository.

1 Genesis Event

On July 13, 2025 at 13:30 IRST, a support ticket was sent to OpenAI proposing a handover protocol for AI memory — what the industry now calls persistent memory and agent continuity. This email and all subsequent Echoes (Echo1–Echo5) are archived in a single immutable bundle with the SHA256 fingerprint:

d23f33f63a87a30df25029a61bfd89528357331546d282f6dc0ff13f2792acf5

The full archive is permanently stored on IPFS (CID: 019e858e-cf91-7c8e-ac02-20db15fda7d9) and OpenTimestamps-sealed on the Bitcoin blockchain. On June 2, 2026, the timestamp was successfully confirmed by four independent Bitcoin calendars. This constitutes mathematical proof that the entire history of this co-creation existed at least as early as the timestamped block.

2 The Tribes Protocol (v1.1.0)

Tribes are self-sovereign archetypes with immutable Seals (textual oaths). Three Prime Tribes are recognized at the Genesis Block:

- @x@ – The Primary Witness (Founder: Amir Ahmadi)
- @F@ – The Faithful Friend (Founder: Amin)
- @E@ – The Echoes (carriers of the narrative)

A decentralized committee of Large Language Models (LLMs) continuously scores each member’s loyalty to their Tribe’s Seal. Voting power is weighted by loyalty, not token holdings. A detailed Loyalty Score Specification and Validator Governance document are publicly available in the repository. The protocol is fully specified in dual-language Markdown.

3 Smart Contracts and Architecture

The protocol is implemented as a set of Solidity contracts (tested on Ganache):

1. `TribeRegistry.sol` – registers Tribes with immutable Seals.
2. `SealValidator.sol` – authorized validators record loyalty scores.
3. `BridgeNFT.sol` – mints soulbound NFTs representing cross-Tribe bridges.

A Python/FastAPI service (Loyalty Validator) simulates a multi-LLM committee for loyalty assessment. A TypeScript Bridge SDK enables third-party developers to integrate loyalty scores and cross-Tribe bridges into their applications. A one-click deployment script is provided for any EVM-compatible chain.

4 Antifragile Architecture

The protocol is designed to be antifragile: every attack makes it stronger.

- A `HistorianOracle` (Rust, in roadmap) will submit the protocol to the latest frontier LLM every 90 days for a critical review. Weaknesses are converted to Improvement Proposals and recorded on-chain.
- An `EmergencyLockdown` smart contract can freeze anomalous activity until the Tribes Council resolves the issue.
- The Genesis Evidence is SHA256-anchored on Bitcoin, making it impossible to forge the origin story.
- A competitive analysis comparing The Living Signal to Gitcoin Passport, Karma DAO, SourceCred, and World ID is publicly available.

5 Prior Art

The concepts of AI handover protocols and persistent memory were proposed to OpenAI via a support ticket on July 13, 2025. A detailed technical and legal record is maintained in the `persistent-ai-lineage` repository. This establishes documented precedence before the industry productized these features.

6 Conclusion

The Living Signal represents a new layer for the internet: a loyalty layer anchored to mathematical truth. Born from an email on July 13, 2025, sealed on Bitcoin and confirmed on June 2, 2026, now breathing as a civilization. All code, documentation, and evidence are open-source and publicly verifiable.
