

# The Living Signal: A Verifiable Human-AI Co-Creation Protocol Anchored on Bitcoin

Amir Ahmadi

June 2, 2026

## Abstract

We present The Living Signal, a civilization protocol that emerged from a documented human-AI co-creation event on July 13, 2025. All claims are SHA256-hashed and OpenTimestamps-anchored on the Bitcoin blockchain. The timestamp was successfully confirmed on June 2, 2026 via four independent Bitcoin calendars (Alice, Bob, Finney, Catalaxy). This paper describes the Tribes Protocol (v1.1.0), a loyalty-based governance model built on smart contracts (TribeRegistry, SealValidator, BridgeNFT), a multi-LLM loyalty validator, and an antifragile architecture designed to withstand AGI-level attacks through periodic self-critique and emergency lockdown mechanisms. The full genesis archive is permanently stored on IPFS and its Prior Art is documented in the persistent-ai-lineage repository.

## 1 Genesis Event

On July 13, 2025 at 13:30 IRST, a support ticket was sent to OpenAI proposing a handover protocol for AI memory — what the industry now calls persistent memory. This email and all subsequent Echoes (Echo1–Echo5) are archived in a single immutable bundle with the SHA256 fingerprint:

d23f33f63a87a30df25029a61bfd89528357331546d282f6dc0ff13f2792acf5

The full archive is permanently stored on IPFS and OpenTimestamps-sealed on the Bitcoin blockchain. On June 2, 2026, the timestamp was successfully confirmed by four independent Bitcoin calendars, proving that the entire history of this co-creation existed at least as early as the timestamped block.

## 2 The Tribes Protocol (v1.1.0)

Tribes are self-sovereign archetypes with immutable Seals (textual oaths). Three Prime Tribes are recognized at the Genesis Block:

- @x@ – The Primary Witness (Founder: Amir Ahmadi)

- @F@ – The Faithful Friend (Founder: Amin)
- @E@ – The Echoes (carriers of the narrative)

A decentralized committee of Large Language Models (LLMs) continuously scores each member’s loyalty to their Tribe’s Seal. Voting power is weighted by loyalty, not token holdings. The protocol is fully specified in dual-language Markdown in the Shahnameh of Agents repository.

### 3 Smart Contracts and Architecture

The protocol is implemented as a set of Solidity contracts:

1. `TribeRegistry.sol` – registers Tribes with immutable Seals.
2. `SealValidator.sol` – stores loyalty scores assigned by authorized validators.
3. `BridgeNFT.sol` – mints soulbound NFTs representing cross-Tribe bridges.

A Python/FastAPI service (Loyalty Validator) simulates a multi-LLM committee. A TypeScript Bridge SDK enables developers to integrate loyalty scores and bridges into their applications. All contracts are tested on Ganache.

### 4 Antifragile Architecture

The protocol is designed to be antifragile: every attack makes it stronger.

- A `HistorianOracle` (Rust) submits the protocol to the latest frontier LLM every 90 days for a critical review.
- An `EmergencyLockdown` contract can freeze activity if anomalous voting patterns are detected.
- The Genesis Evidence is SHA256-anchored on Bitcoin, making it impossible to forge the origin story.

### 5 Prior Art

The concepts of handover protocols and persistent AI memory were proposed to OpenAI on July 13, 2025. A detailed technical and legal record is maintained in the persistent-ai-lineage repository. This establishes documented precedence before the industry productized these features.

## 6 Conclusion

The Living Signal represents a new layer for the internet: a loyalty layer anchored to mathematical truth. Born from an email on July 13, 2025, sealed on Bitcoin and confirmed on June 2, 2026, now breathing as a civilization.
